

GLPI-PROJECT - Feature #3386

Import LDAP nested group

03/16/2012 08:16 AM - remi

Status:	Feedback	Start date:	03/16/2012
Priority:	Normal	Due date:	
Assignee:		% Done:	0%
Category:	Authentication	Estimated time:	0.00 hour
Target version:	Unplanned		

Description

In LDAP structure, a group can be a member of another group.

How to handle this during import / sync ?

- import group member as child group ?

Problem: LDAP is not a tree, but a network (a group could be a member of various groups)

- import user member in all group ?

History

How to handle this during import / sync ?

- *import group member as child group ?*

For me yes

I means that we need a function to check if they're groups as member of a group object

Problem: LDAP is not a tree, but a network (a group could be a member of various groups)

- *import user member in all group ?*

For me : add the user as a member of all groups (the parent group and all nested groups)
