Description

Hello,

i have a glpi with generic objects 2.3.2 and the location field contains

Eurostation > 1040

When i try to move from one entity to a lower entity i got this message

Fatal error: Call to undefined function addslashes_deep() in /var/www/glpi/plugins/genericobject/inc/object.class.php on line 882

```
        $tmp = array();
        $where = "";
//        if ($dropdown instanceof CommonTreeDropdown) {
//            $tmp['completename'] = $dropdown->fields['completename'];
//            $where          = "`completename`=" .
//                addslashes_deep($tmp['completename'])."";
//        } else {
//            $tmp['name'] = $dropdown->fields['name'];
//            $where      = "`name`=" . addslashes_deep($tmp['name'])."";
//        }
        $tmp['entities_id'] = $new_entity;
        $where             .= " AND `entities_id`=" . $tmp['entities_id']."";
```

when commenting the part above the error disappears, of course i don't know what others effet this can have with this part commented

Cheers
