Description

abeudin propose this patch to add error in apache log when user failed to authenticate and so after can manage easily with fail2ban

```
--- /var/www/html/glpi/front/login.php 2015-06-02 17:04:19.166978952 +0200
+++ /var/www/html/glpi/front/login-new.php 2015-06-02 17:07:19.910986317 +0200

} else {
    // we have done at least a good login? No, we exit.
+   error_log('GLPI error : Incorrect username or password', 0);
    Html::nullHeader("Login", $CFG_GLPI["root_doc"] . '/index.php');
    echo '<div class="center b">' . $auth->getErr() . '<br><br>';
    // Logout whit noAUto to manage auto_login with errors
```

We have in log a line like

```
[Tue Jun 02 17:11:25.174434 2015] [:error] [pid 15813] [client 192.168.100.17:55663] GLPI error : Incorrect username or password, referer: http://192.168.100.16/glpi/
```

Seems a good idea.
